Attention: Vincent Magers, Dockmaster, NASSCO San Diego

Subject: Memo – BUILDER FDD, Keel Line Loading Capacity (2022)

Enclosures: (1) HEGER's Pontoon Deck gauging plan, dated 1/10/2022
(2) Pontoon Deck UT survey results, dated 1/23/2022
(2) HEGER's Pontoon Deck Analysis, dated 2/4/2022

Reference: (A) Memo – BUILDER FDD Revised Operational Limits and Repair Plan (2021), dated 11/23/2021

1.0 Introduction

HEGER DRY DOCK, Inc. (HDD) was previously tasked by NASSCO SAN DIEGO to conduct an engineering review of the aging BUILDER dry dock, suggest operational parameters/limitations, and develop a repair plan for current or future corrosion. In summary, HDD identified it is imperative to closely monitor the condition of the corroding pontoon deck and adjust the operational limitations of the keel line loading capacity based on surveyed findings. Refer to Reference A for additional information.

Following the submittal of Reference A to NAVSEA and subsequent conversations, the following procedure was tentatively agreed upon for determining certifiable keel line loading capacities on a biennial basis (every other year):

1. Conduct a comprehensive Ultrasonic Thickness (UT) gauging survey of the middle 80-ft of the dock's pontoon deck plating; this areas contributes to transverse strength and keel line loading capacities. Gauging shall be done in a tight grid (i.e. a belt along every BHD frame with a transverse spacing of 8' between measurements). The location of the belts, from survey to survey, shall shift 2' along the length of the dock.
2. HDD will calculate the average pontoon deck thickness for each of the three different dock sections (i.e. Original, NASSCO, and Strengthened).
3. Once the averages are determined for each section, a thickness of 0.026-inches will be subtracted from the average; this accounts for potential future corrosion in the 2-years between gauging surveys, per NSTM 100 Category D. These adjusted UT averages will be referred to as the "Corrected UT Average" for each section.
4. The "Corrected UT Average" will be used in combination with "HEGER's recommended keel line capacity chart" to determine the keel line capacity for each section.

Heger Dry Dock, Inc.

BUILDER FDD, Keel Line Loading Capacity (2022)

Furthermore, if the rated capacity of the dock falls below the desired rating and affects the ability to dock certain NAVY vessel classes, repairs to corroded areas of the dock could be implemented to increase the keel line loading capacity of the dock once repairs are completed and adequately signed off on.

2.0 Gauging Survey Results

HDD developed a pontoon deck gauging plan for NASSCO to execute (refer to Enclosure 1). HDD's plan called for 65 belts along the length of the dock (a 12' spacing); each belt specified 13 measurements in the middle 80-ft of the dock.

In the event a measurement was taken, with corrosion levels exceeding 20%, a more refined grid (see sketch below) was taken around the reading to better ascertain the general condition of the area and rule out any potential "bad" quality UT measurements. An average of all 9 shots, in the refined grid, was taken as the measurement for the specified location.

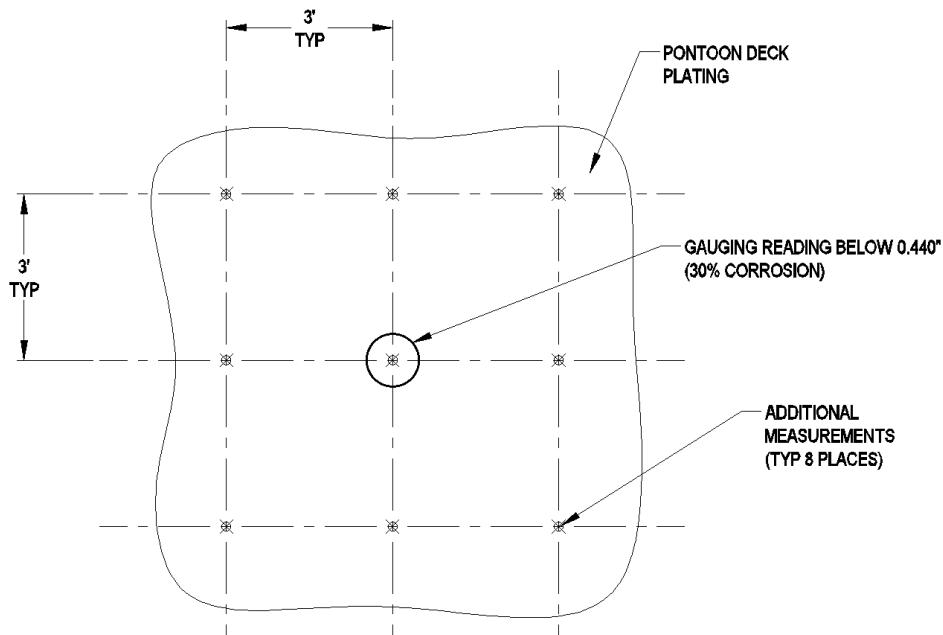

FIGURE 1 - REFINED GAUGING GRID IN WAY OF LOCALIZED CORROSION UT

The results of the survey attached in Enclosure 2. The gauging results were used as the basis for HEGER's analysis which is attached in Enclosure 3.

In general the condition of the plating was found to be as follows:

	Strengthened Section	NASSCO Section	Original Section
Average Measurement	0.590-in	0.630-in	0.578-in
Percent Wasted	6%	0%	8%
Corrosion Rate since 2020 (for reference)	0.09 mm/yr	0.08 mm/yr	0.09 mm/yr

Refer to the figure, on the next page, for a general arrangement illustrating the 3 different dock sections:

Heger Dry Dock, Inc.

BUILDER FDD, Keel Line Loading Capacity (2022)

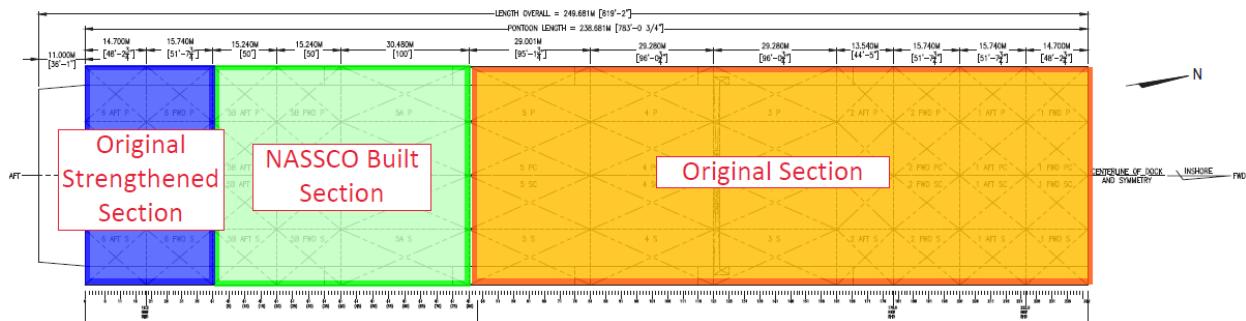

FIGURE 2 - PLAN VIEW OF BUILDER FDD

3.0 Keel Line Loading Capacity

HEGER previously provided the “recommended structural capacity vs pontoon deck corrosion” curve, shown in Figure 3, to determine keel line loading capacities of the dock based on the surveyed levels of corrosion. The curve plots pontoon deck corrosion levels along the horizontal axis against structural keel line loading capacities along the vertical axis for the three different pontoon section designs. The chart was developed with principle stress calculations and substantiated with detailed Finite Element Analysis (FEA). Refer to Reference A for further details.

HEGER RECOMMENDED STRUCTURAL CAPACITY VS PONTOON DECK CORROSION

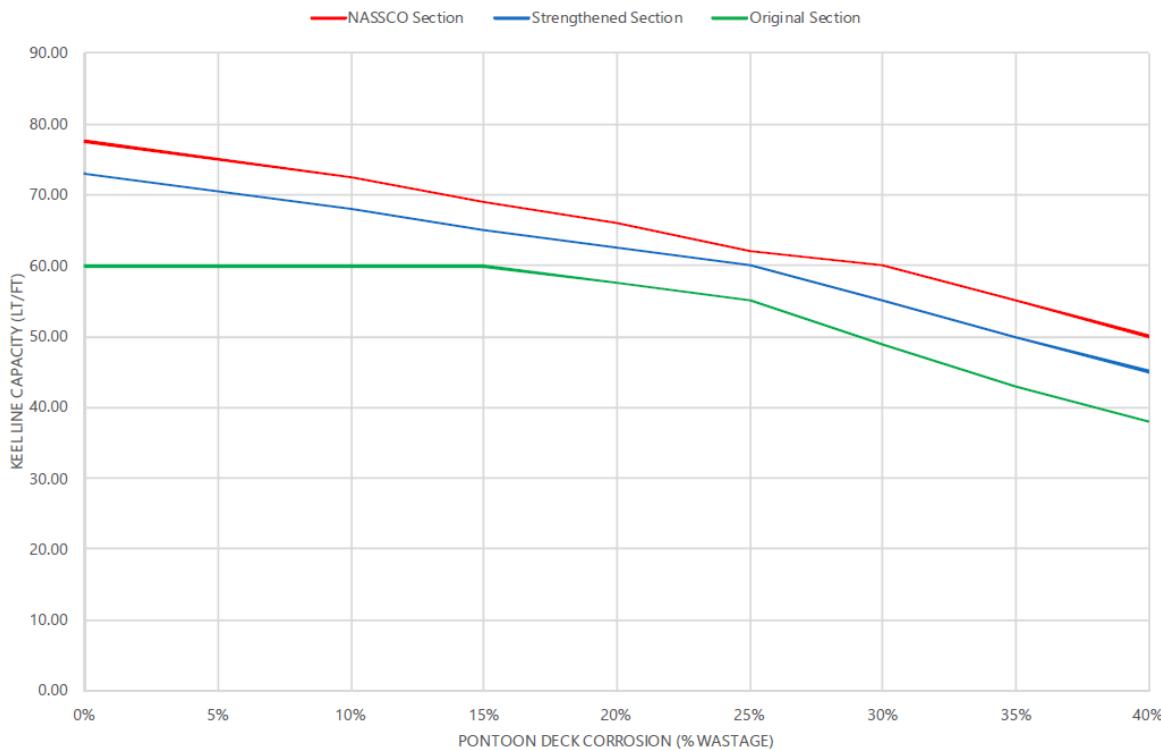

FIGURE 3 - CHART OF KEEL LINE CAPACITY VS PONTOON DECK CORROSION

NOTE: The levels of pontoon deck corrosion only pertain to the middle 80-ft of the dock; plating further outboard does not significantly contribute to the keel line capacity of the dock and its minimum plating thicknesses is governed by head pressure limitation or vehicular loading demands.

Heger Dry Dock, Inc.

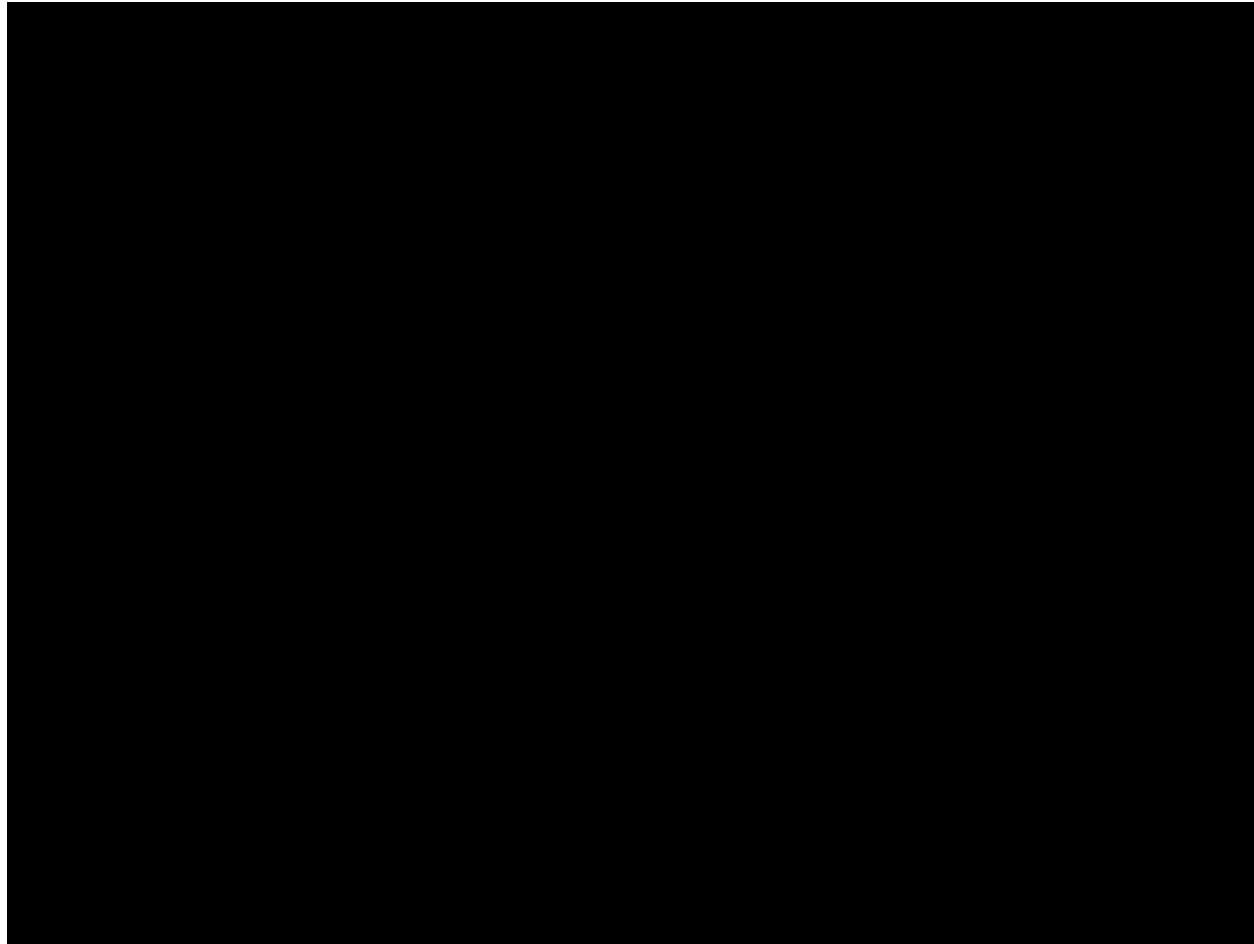

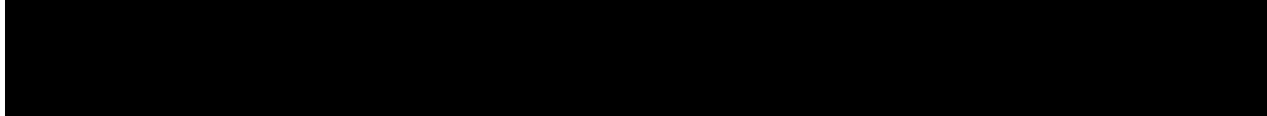

BUILDER FDD, Keel Line Loading Capacity (2022)

The average readings for each dock section, presented in Section 2.0 of this memorandum, were corrected for potential future corrosion that may occur in the next 2-years. The loss of material thickness over the 2-years was taken a 0.026-inches (0.33 mm/yr) based on NSTM 100 Category D as a standard. The assumed loss of thickness essentially adds 4% of wastage to the surveyed average. The corrected average UT measurements, for each section, are as follows:

	<u>Strengthened Section</u>	<u>NASSCO Section</u>	<u>Original Section</u>
Corrected Average UT Measurement	0.564-in	0.604-in	0.552-in
Percent Wasted	10%	4%	12%

The keel line loading capacities associated with the “Corrected Average UT Measurement” provided above are as follows:

- Strengthened Section, Frame 242 to 42 (484-ft) = 67.4 LT/ft
- NASSCO Section, Frame 42 to 41 (200-ft)= 75.3 LT/ft
- Original Section, Frame 41 to 0 (100-ft) = 60.0 LT/ft

Heger Dry Dock, Inc.

BUILDER FDD, Keel Line Loading Capacity (2022)

4.0 Conclusion

Based on HEGER's review of the BUILDER's recently conducted pontoon deck gauging surveys, the following keel line loading capacities are recommended:

- Strengthened Section, Frame 242 to 42 (484-ft) = 67.4 LT/ft
- NASSCO Section, Frame 42 to 41 (200-ft)= 75.3 LT/ft
- Original Section, Frame 41 to 0 (100-ft) = 60.0 LT/ft

Furthermore, in review of the UT data, HDD noticed that all gauging measurements were within the pontoon deck plating corrosion tolerance of 35% wastage. As such, HEGER does not recommend any repairs to the plating deck structure at this time. However, the plating thickness of the deck shall continue to be monitored in future surveys to ensure the corrosion levels below 35% are maintained.

Please contact us if you have any questions or comments regarding the analysis summarized in this memorandum.
